ORNION - PERSONAL AI ASSISTANT

ORNION - Installation and User Guide | Created and developed by Praneeth Thota

What is ORNION?

A voice-and-text-controlled Personal AI Assistant and Automation Platform created by Praneeth Thota. Features desktop app launching, YouTube & Google search automation, WhatsApp Web message drafting, unread email briefings, live stock market technical analysis (SMA Buy/Sell signals), and the 3D ORNION Neural Interface HUD.

1. Prerequisites

- Operating System: Windows 10/11 (Primary Development Environment), macOS, or Linux.
- Python: Python 3.10 or newer (download from https://python.org).
- Optional Groq API Key: Free cloud LLM API key from https://console.groq.com/keys.

2. Step-by-Step Installation (ORNION Setup)

Step 1: Open the ORNION project folder on your computer.

Step 2: Run the automated installer:

On Windows: Double-click install.bat or run 'install.bat' in Command Prompt.
On macOS / Linux: Run 'chmod +x install.sh && ./install.sh' in Terminal.

Step 3: Paste your Groq API key when prompted (saved to ~/.ornion/free.key) or press Enter to run in Local Action Mode.

Step 4: Launch ORNION at any time with: python jarvis_voice.py

Step 5: Open http://127.0.0.1:8765 in your browser for the ORNION Neural Interface HUD.

3. Key Features & Voice Commands

- "Ornion, open VS Code" -> Launches VS Code, Chrome, Notepad, Calculator, or installed apps.
- "Play lofi on YouTube" -> Opens YouTube search in your default browser.
- "Stock market report" -> Connects to Yahoo Finance for Nifty 50, Sensex, Reliance, Nvidia & BTC.
- "Should I buy Reliance?" -> Calculates 5/15 SMA crossover & momentum for BUY / SELL / HOLD signal.
- "Send WhatsApp to Pallavi..." -> Opens WhatsApp Web with your drafted message pre-filled.
- "Check my unread emails" -> Summarizes cached priority inbox items into a spoken briefing.
- "Volume up" / "Mute" -> Adjusts or mutes system audio volume.

4. Hybrid Cloud + Local Cooldown Fallback

When cloud LLM endpoints reach a rate limit (HTTP 429):

- ORNION parses the retry-after cooldown duration from the API response.
- During cooldown, deterministic commands (apps, time/date, volume, WhatsApp URL, YouTube URL, and stock chart queries) continue executing locally in Python.

5. ORNION Neural Interface HUD (http://127.0.0.1:8765)

Open http://127.0.0.1:8765 (or jarvis_workplace.html) in any browser to view:

- Rotating 3D wireframe globe and segmented reactor rings.
- Real-time voice frequency oscilloscope synced to microphone input.
- Live stock market ticker panel with sparklines and Buy/Sell/Hold indicators.

6. Quick Setup Summary (Tenglish)

1. Mee computer lo Python 3.10+ install chesukondi (python.org).
2. Windows lo install.bat double-click cheyandi, Mac/Linux lo ./install.sh run cheyandi.
3. Groq API key (console.groq.com nunchi) unte paste cheyandi leda Enter nokkandi.
4. python jarvis_voice.py run chesi "Ornion, open VS Code" or "Stock market report" ani cheppandi.
5. ORNION Neural Interface HUD kosam browser lo http://127.0.0.1:8765 open cheyandi.
